

The End of Waste.

Turning every home into a closed-loop resource system – where discarded materials become energy, fertilizer, and feedstock. Never garbage.

TEAM
Ivana Okpakovwodo Wasiq Salman Veronica Rodriguez Angelina Usenko

01 - THE PROBLEM

A system built to remove, not recover.

- Relies entirely on people sorting correctly
- Contamination destroys recyclable material at scale
- Waste travels far before any value is recovered
- Billions spent managing materials that still have worth
- Pollution reaches oceans and ecosystems regardless

02 - THE SHIFT

The home becomes a mini resource plant.

Not a better recycling system – a new model entirely. Each home automatically identifies, separates, and converts materials into useful outputs locally. No manual sorting. No trucks required. Waste stops being something to remove. It becomes something to convert.

03 - HOW IT WORKS — FIVE STEPS. NO SORTING REQUIRED.

04 - OUTPUTS

What the home produces.

● Energy Electricity fed back to the home	● Heat Thermal energy from conversion	● Biogas Methane for cooking
● Fertilizer Compost for gardens	● Feedstock Processed plastic reused locally	● Future Goods On-site fabrication

05 - WHY THIS IS 10X

A category shift.

0x	Manual sorting required from residents
-	Contamination eliminated at source
∞	Local value loops replace distant chains
-	Fewer trucks, landfills, sorting plants
+	Homes become net resource producers

06 - VISION

”The future is not better recycling.
The future is no such thing as waste.”

Society shifts from waste management to distributed resource generation – fewer landfills, less pollution, homes that continuously produce value from what they once discarded.
